

A single-core optical module

Overview

o In optical modules, "core" refers to the light-transmitting channel in the fiber. A 1-core module uses a single fiber core for data transmission, while a 2-core module uses two cores. A 1-core fiber is like a single-lane road—only one car (or data signal) can travel at a. Single-core module has only one optical fiber port optical module products, only one fiber can be inserted at the same time optical signal Launch and receive, is a solution to save fiber resources. So do you know how the single-core module works?

Then I give you one by one answer: 1. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. Gigabit single-mode single-core optical fiber modules usually have the following specifications: multi-mode 550m, single-mode 15km, 40km, 80km, 120km, etc.
