

Color-galvanized cable trays

AI Overview

For galvanized cable trays, color selection is primarily determined by the type of galvanization and environmental exposure, with hot-dip galvanized trays offering superior corrosion protection for outdoor or high-moisture areas.

Understanding Galvanized Finishes

Pre-galvanized (PG) trays are coated with a thin zinc layer, typically 12–20 microns, and are suitable for dry indoor environments such as office buildings or clean factories. These trays are usually polished and have a metallic silver appearance, which is often the default color for indoor installations. Hot-dip galvanized (HDG) trays are immersed in molten zinc, creating a thicker, more durable coating of 65–85 microns. This process ensures that every edge, corner, and hole is protected, making HDG trays ideal for outdoor, wet, or corrosive environments. The resulting color is typically a matte or slightly bluish-gray finish, which develops a protective patina over time.

Color Considerations

While galvanized trays are generally metallic in appearance, color can be applied for identification, safety, or aesthetic purposes. However, the underlying galvanization type dictates the tray's corrosion resistance:

- Indoor, low-humidity areas: Pre-galvanized trays with a polished silver finish are sufficient.
- Outdoor or high-moisture areas: Hot-dip galvanized trays with a matte gray finish are recommended to prevent rust and extend service life.
