

Data Center Rack Leakage Protection Switch

AI Overview

A Data Center Rack Leakage Protection Switch is a sensor-based system designed to detect water or fluid intrusion near server racks and trigger alerts or automated responses to prevent equipment damage.

Overview

Leakage protection switches in data centers are critical for safeguarding servers, networking devices, and UPS systems from water, condensate, or coolant leaks. These systems detect the presence of liquids and can either alert operators or automatically shut down affected circuits to prevent short circuits, equipment failure, or fire hazards ().

Types of Leak Detection

- Point Sensors
 - Detect water at a specific location, such as under a CRAC unit, near pipe joints, or at valve connections.
 - Trigger immediate alerts when water contacts the sensor tip.
 - Ideal for high-risk areas where leaks are likely to originate ().
- Cable or Rope Sensors
 - Flexible cables placed along the bottom of racks or under raised floors.
 - Provide linear coverage, detecting leaks along the entire length of the cable.
