

The function of the optoelectronic insertion module

Overview

Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa. After transmission through the. The optical module is one of the core devices of the optical communication system, and its development has a vital impact on its related industrial chain, from the upstream industry chip substrate, PCB to the downstream telecom market and data communication market, and the field of lidar driverless. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. They are used in fiber optic communication systems to transmit data over long distances with minimal loss and interference.
